CBME – The future of Medical Education

In India, competency-based medical education (CBME) is gaining foothold to transform the medical student into a doctor fulfilling community and societal needs.

The traditional undergraduate medical curriculum has faced tremendous criticism during the last few decades for being fragmented and overloaded and driving students to learn by rote and attain knowledge passively instead of inquisitiveness and exploration. Both teaching-learning activities and assessment focused more on acquiring knowledge and not on skill acquisition, nor on patient doctor communication nor attitude.

CBME is an outcomes-based approach to medical education and one of the key aspects that it reforms are assessments.

CBME emphasizes a shift from teacher-centered to learner-centered educative methods and a systematic interdisciplinary integrated learning rather than piecemeal information in each department. Another noteworthy alteration is problem-based learning which triggers the scholar to arm himself with knowledge crucial to encounter and solve real-life problems within the hospital or community.

Implementing CBME, however, comes with significant challenges. Even though, challenges are there, but it is important to understand and have a belief that all this has been done to improve the health care services offered to the general population. The competency-based curriculum for undergraduate students has to be looked upon as an opportunity to produce competent and globally acceptable doctors and thus it is high time that all the stakeholders accept this as a challenge and work in a concerted manner to accomplish the intended goals.

Change is the only constant and everything needs to advance.' So does medical education.

Proper implementation of the principles of CBME seems to be a demanding exercise in terms of manpower and resources. Another big challenge is desired change in attitude and approach of teachers. Frequent training programs to update faculty members in CBME. Capacity building of faculty is the key determinant of successful implementation of curriculum. In nutshell CBME is the future of medical education and is already being implemented across India.

The benefits of CBME apply to not only students and faculty, but also to patients.

Departmental Snippets
