Artificial Intelligence: A game-changer for the Indian Education System

According to the statistics given by the Human Resource & Development (HRD) Ministry of India in 2016, there is a shortage of 1 million teachers across the country. In the case of Universities and Colleges, there is a chronic shortage of faculty and the problem of finding qualified people to fill this gap has become even more complicated.

In such a scenario, how can India, a country with the second largest population in the world, cope with the challenge of providing quality education to all? Several education experts are saying that our system needs a revolutionary technological intervention. An intervention that would make it more inclusive and accessible. Bringing Artificial Intelligence (AI) to the classrooms in India might just be the solution that we have been looking for. We still remember those days when libraries used to be the only way to access resources required for learning, be it during schools or colleges. However, the scenario over the last few decades has changed and now the access to all teaching and learning resources is a click away.

AI is all set to redesign and reinvent the education sector. The combination of teachers' expertise and the best of machines will shape the future of education and the whole concept of learning. The usage of technology in education has revolutionized education systems with better reach and improved execution.

The role of teachers in education systems is irreplaceable; however, AI will aid and improve a teacher's job. AI is expected to fill the gaps in teaching learning methodology and its delivery.

Jewels of NKP

Dr. Neena Nagdeo delivered Presidential oration on "Micro-Clinician 'SMART' Friendship" at XXVI Maharashtra chapter conference of IAMM on 17th September 2022 at BJGMC Pune.

International Conference presentation :
